

DRIVER SIGNATURE ENFORCEMENT OVERRIDER (DSEO) FOR WINDOWS 7

CAUTION:

First and foremost; you are using this software at your own risk. I do not take responsibility for any damage to your system and/or application software installations.

Secondly, you must run DSEO with Administrative privileges
(Right click Installer and choose Run as Administrator)

DSEO INSTALLATION:

STEP 1. Before proceeding, it is highly recommended that you CREATE a System Restore point and LABEL it appropriately.

STEP 2. Download DSEO

<http://happyharry.net/apps/dseo.exe>

Double-click **dseo.exe** which will deploy a Folder with the program and READ_ME file.

STEP 3. Run the installer "as Administrator". Inside its main menu, press on the "Enable Test Mode" button and follow the on-screen instructions. This will enable TESTSIGNING mode, which allows unverified system files to be loaded.

STEP 4. Now all you have to do is to add the unverified signature to the required system files. To do so press on the "Sign a System File" button from the main menu, and enter specific filename including full path.

For example: If ATITool64.sys from C:\Windows\System32\drivers

refuses to load due to Driver Signature Enforcement, you should type:

"C:\Windows\System32\drivers\ATITool64.sys"

STEP 5. If you would like to sign more than a single file, just repeat this procedure until you're done, and finally reboot.

STEP 6. After you enabled Test Mode and added signatures to the required system files, they should bypass Windows' s driver signature enforcement and load without any issues.

STEP 7. If you want to revert the process, you can re-launch the application and choose:

"Disable Test Mode" from the main menu, and Restart your PC.

STEP 8. Alternatively, you can run System Restore and load the Restore point that you created in Step 1.

STEP 9. Change FireWire driver to legacy mode.
